

Premium and Constructed Per-Tank Expected Loss Across Age Bins

Backup view: per-tank EL = $\hat{h} \times \hat{L} / n_{\text{tanks}}$, where $\hat{L}$ is a control-state donor curve (no TX cost data exists)

Notes: Per-tank premium as in main figure. Per-tank expected loss = $\hat{h} \times \hat{L} / n_{\text{tanks}}$, computed at the tank-month level using each
